Alert Detail

Alto	Cross Site Scripting (Persistent)
Descrizione	Cross-site Scripting (XSS) is an attack technique that involves echoing attacker-supplied code into a user's browser instance. A browser instance can be a standard web browser client, or a browser object embedded in a software product such as the browser within WinAmp, an RSS reader, or an email client. The code itself is usually written in HTML /JavaScript, but may also extend to VBScript, ActiveX, Java, Flash, or any other browser-supported technology. When an attacker gets a user's browser to execute his/her code, the code will run within the security context (or zone) of the hosting web site. With this level of privilege, the code has the ability to read, modify and transmit any sensitive data accessible by the browser. A Cross-site Scripted user could have his/her account hijacked (cookie theft), their browser redirected to another location, or possibly shown fraudulent content delivered by the web site they are visiting. Cross-site Scripting attacks essentially compromise the trust relationship between a user and the web site. Applications utilizing browser object instances which load content from the file system may execute code under the local machine zone allowing for system compromise. There are three types of Cross-site Scripting attacks: non-persistent, persistent and DOM-based. Non-persistent attacks and DOM-based attacks require a user to either visit a specially crafted link laced with malicious code, or visit a malicious web page containing a web form, which when posted to the vulnerable site, will mount the attack. Using a malicious form will oftentimes take place when the vulnerable resource only accepts HTTP POST requests. In such a case, the form can be submitted automatically, without the victim's knowledge (e.g. by using JavaScript). Upon clicking on the malicious link or submitting the malicious form, the XSS payload will get echoed back and will get interpreted by the user's browser and execute. Another technique to send almost arbitrary requests (GET and POST) is by using an embedded client, such as Adobe Flash. Persistent attacks occur when the malicious code is submitted to a web site where it's stored for a period of time. Examples of an attacker's favorite targets often include message board posts, web mail messages, and web chat software. The unsuspecting user is not required to interact with any additional site/link (e.g. an attacker site or a malicious link sent via email), just simply view the web page containing the code.

Instances	26
	Phase: Architecture and Design Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid. Examples of libraries and frameworks that make it easier to generate properly encoded output include Microsoft's Anti-XSS library, the OWASP ESAPI Encoding module, and Apache Wicket. Phases: Implementation; Architecture and Design Understand the context in which your data will be used and the encoding that will be expected. This is especially important when transmitting data between different components, or when generating outputs that can contain multiple encodings at the same time, such as web pages or multi-part mail messages. Study all expected communication protocols and data representations to determine the required encoding strategies. For any data that will be output to another web page, especially any data that was received from external inputs, use the appropriate encoding on all non-alphanumeric characters. Consult the XSS Prevention Cheat Sheet for more details on the types of encoding and escaping that are needed. Phase: Architecture and Design For any security checks that are performed on the client side, ensure that these checks are duplicated on the server side, in order to avoid CWE-602. Attackers can bypass the client-side checks by modifying values after the checks have been performed, or by changing the client to remove the client-side checks entirely. Then, these modified values would be submitted to the server. If available, use structured mechanisms that automatically enforce the separation between data and code. These mechanisms may be able to provide the relevant quoting, encoding,

Solution	and validation automatically, instead of relying on the developer to provide this capability at every point where output is generated. Phase: Implementation For every web page that is generated, use and specify a character encoding such as ISO-8859-1 or UTF-8. When an encoding is not specified, the web browser may choose a different encoding by guessing which encoding is actually being used by the web page. This can cause the web browser to treat certain sequences as special, opening up the client to subtle XSS attacks. See CWE-116 for more mitigations related to encoding/escaping. To help mitigate XSS attacks against the user's session cookie, set the session cookie to be HttpOnly. In browsers that support the HttpOnly feature (such as more recent versions of Internet Explorer and Firefox), this attribute can prevent the user's session cookie from being accessible to malicious client-side scripts that use document.cookie. This is not a complete solution, since HttpOnly is not supported by all browsers. More importantly, XMLHttpRequest and other powerful browser technologies provide read access to HTTP headers, including the Set-Cookie header in which the HttpOnly flag is set. Assume all input is malicious. Use an "accept known good" input validation strategy, i.e., use an allow list of acceptable inputs that strictly conform to specifications. Reject any input that does not strictly conform to specifications, or transform it into something that does. Do not rely exclusively on looking for malicious or malformed inputs (i.e., do not rely on a deny list). However, deny lists can be useful for detecting potential attacks or determining which inputs are so malformed that they should be rejected outright. When performing input validation, consider all potentially relevant properties, including length, type of input, the full range of acceptable values, missing or extra inputs, syntax, consistency across related fields, and conformance to business rules. As an example of business rule logic, "boat" may be syntactically valid because it only contains alphanumeric characters, but it is not valid if you are expecting colors such as "red" or "blue." Ensure that you perform input validation at well-defined interfaces within the application. This will help protect the application even if a component is reused or moved elsewhere.

Data was returned for the original parameter. The vulnerability was detected by successfully restricting the data originally returned, by manipulating the parameter.
Instances	18
	Do not trust client side input, even if there is client side validation in place. In general, type check all data on the server side.

Solution	If the application uses JDBC, use PreparedStatement or CallableStatement, with parameters passed by '?'
	If the application uses ASP, use ADO Command Objects with strong type checking and parameterized queries.
	If database Stored Procedures can be used, use them.
	Do *not* concatenate strings into queries in the stored procedure, or use 'exec', 'exec immediate', or equivalent functionality!
	Do not create dynamic SQL queries using simple string concatenation.
	Escape all data received from the client.
	Apply an 'allow list' of allowed characters, or a 'deny list' of disallowed characters in user input.
	Apply the principle of least privilege by using the least privileged database user possible.
Reference	In particular, avoid using the 'sa' or 'db-owner' database users. This does not eliminate SQL injection, but minimizes its impact.
	Grant the minimum database access that is necessary for the application.

Medio	Content Security Policy (CSP) Header Not Set
Descrizione	Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware. CSP provides a set of standard HTTP headers that allow website owners to declare approved sources of content that browsers should be allowed to load on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embeddable objects such as Java applets, ActiveX, audio and video files.

Solution	Modern Web browsers support the Content-Security-Policy and X-Frame-Options HTTP headers. Ensure one of them is set on all web pages returned by your site/app. If you expect the page to be framed only by pages on your server (e.g. it's part of a FRAMESET) then you'll want to use SAMEORIGIN, otherwise if you never expect the page to be framed, you should use DENY. Alternatively consider implementing Content Security Policy's "frame-ancestors" directive.

Evidence	javax.servlet.http.HttpServlet.service(HttpServlet.java:555)
Altre Info	
URL	http://localhost:8080/Gradle___Tourism_1_0_SNAPSHOT_war_exploded_/ModifyRoom1
Metodo	POST
Attacco	
Evidence	javax.servlet.http.HttpServlet.service(HttpServlet.java:555)
Altre Info	
URL	http://localhost:8080/Gradle___Tourism_1_0_SNAPSHOT_war_exploded_/ModifyTransport1
Metodo	POST
Attacco	
Evidence	javax.servlet.http.HttpServlet.service(HttpServlet.java:555)
Altre Info	
Instances	15
Solution	Identify the cause of the error and fix it. Do not trust client side input and enforce a tight check in the server side. Besides, catch the exception properly. Use a generic 500 error page for internal server error.
Reference	
CWE Id	472
WASC Id	20

Plugin Id	40008
Medio	XSLT Injection
Descrizione	Injection using XSL transformations may be possible, and may allow an attacker to read system information, read and write files, or execute arbitrary code.
URL	http://localhost:8080/Gradle___Tourism_1_0_SNAPSHOT_war_exploded_/User/Payment.jsp?id=1&total=%3Cxsl%3Avalue-of+select%3D%22system-property%28%27xsl%3Avendor%27%29%22%2F%3E&packagename=green+building&place=missori
Metodo	GET
Attacco	<xsl:value-of select="system-property('xsl:vendor')"/>
Evidence	Apache
Altre Info	The XSLT processor vendor name "Apache" was returned after an injection request.
URL	http://localhost:8080/Gradle___Tourism_1_0_SNAPSHOT_war_exploded_/User/Payment.jsp?id=1&total=520&packagename=%3Cxsl%3Avalue-of+select%3D%22system-property%28%27xsl%3Avendor%27%29%22%2F%3E&place=missori
Metodo	GET
Attacco	<xsl:value-of select="system-property('xsl:vendor')"/>
Evidence	Apache
Altre Info	The XSLT processor vendor name "Apache" was returned after an injection request.
Instances	2
Solution	Sanitize and analyze every user input coming from any client-side.
Reference	https://www.contextis.com/blog/xslt-server-side-injection-attacks
CWE Id	91
WASC Id	23
Plugin Id	90017

Basso	Cookie without SameSite Attribute
Descrizione	A cookie has been set without the SameSite attribute, which means that the cookie can be sent as a result of a 'cross-site' request. The SameSite attribute is an effective counter measure to cross-site request forgery, cross-site script inclusion, and timing attacks.
URL	http://localhost:8080/Gradle___Tourism_1_0_SNAPSHOT_war_exploded_/
Metodo	GET
Attacco	
Evidence	Set-Cookie: JSESSIONID
Altre Info	
Instances	1
Solution	Ensure that the SameSite attribute is set to either 'lax' or ideally 'strict' for all cookies.
Reference	https://tools.ietf.org/html/draft-ietf-httpbis-cookie-same-site
CWE Id	1275
WASC Id	13
Plugin Id	10054

Basso	Cross-Domain JavaScript Source File Inclusion

Plugin Id	10017

Basso	X-Content-Type-Options Header Missing
Descrizione	The Anti-MIME-Sniffing header X-Content-Type-Options was not set to 'nosniff'. This allows older versions of Internet Explorer and Chrome to perform MIME-sniffing on the response body, potentially causing the response body to be interpreted and displayed as a content type other than the declared content type. Current (early 2014) and legacy versions of Firefox will use the declared content type (if one is set), rather than performing MIME-sniffing.

Attacco	
Evidence	
Altre Info	This issue still applies to error type pages (401, 403, 500, etc.) as those pages are often still affected by injection issues, in which case there is still concern for browsers sniffing pages away from their actual content type. At "High" threshold this scan rule will not alert on client or server error responses.
Instances	65
Solution	Ensure that the application/web server sets the Content-Type header appropriately, and that it sets the X-Content-Type-Options header to 'nosniff' for all web pages. If possible, ensure that the end user uses a standards-compliant and modern web browser that does not perform MIME-sniffing at all, or that can be directed by the web application /web server to not perform MIME-sniffing.

Informativo	Cookie con ambito non stringente
Descrizione	Cookies can be scoped by domain or path. This check is only concerned with domain scope. The domain scope applied to a cookie determines which domains can access it. For example, a cookie can be scoped strictly to a subdomain e.g. www.nottrusted.com, or loosely scoped to a parent domain e.g. nottrusted.com. In the latter case, any subdomain of nottrusted.com can access the cookie. Loosely scoped cookies are common in mega-

	applications like google.com and live.com. Cookies set from a subdomain like app.foo.bar are transmitted only to that domain by the browser. However, cookies scoped to a parent-level domain may be transmitted to the parent, or any subdomain of the parent.
URL	http://localhost:8080/Gradle___Tourism_1_0_SNAPSHOT_war_exploded_/
Metodo	GET
Attacco	
Evidence	
Altre Info	The origin domain used for comparison was: localhost JSESSIONID=985FB83FB60BBF02D891BED2B02D6757
Instances	1
Solution	Always scope cookies to a FQDN (Fully Qualified Domain Name).

Informativo	User Controllable HTML Element Attribute (Potential XSS)
Descrizione	This check looks at user-supplied input in query string parameters and POST data to identify where certain HTML attribute values might be controlled. This provides hot-spot detection for XSS (cross-site scripting) that will require further review by a security analyst to determine exploitability.
URL	http://localhost:8080/Gradle___Tourism_1_0_SNAPSHOT_war_exploded_/User/Payment.jsp?id=1&total=520&packagename=green%20building&place=missori
Metodo	GET
Attacco	
Evidence	
Altre Info	User-controlled HTML attribute values were found. Try injecting special characters to see if XSS might be possible. The page at the following URL: http://localhost:8080/Gradle___Tourism_1_0_SNAPSHOT_war_exploded_/User/Payment.jsp?id=1&total=520&packagename=green%20building&place=missori appears to include user input in: a(n) [meta] tag [content] attribute The user input found was: id=1 The user-controlled value was: width=device-width, initial-scale=1
URL	http://localhost:8080/Gradle___Tourism_1_0_SNAPSHOT_war_exploded_/User/Payment.jsp?id=1&total=520&packagename=green%20building&place=missori
